Signals delivered to B cells via CD40 can synergize with those provided by other B cell surface receptors to induce B cell proliferation and antibody class switching as well as modulate cytokine production and cell adhesion. Recently, it has been shown that the ligand for CD40 is a cell surface protein of approximately 39 kDa expressed by activated T cells, gp39. Here we report on the isolation and characterization of a cDNA clone encoding human gp39, a type II membrane protein with homology to TNF, and the construction and characterization of a soluble recombinant form of gp39. COS cell transfectants expressing gp39 synergized with either anti-CD20 mAb or PMA to drive strong B cell proliferation and alone were able to drive B cells to proliferate weakly. In all cases the B cell proliferation induced by gp39-expressing COS cells was reduced to background levels by the addition of soluble CD40. Unlike gp39-expressing COS cells, recombinant soluble gp39 was not mitogenic alone and required co-stimulation to drive B cell proliferation. These results suggest that B cells require a second signal besides gp39-CD40 to drive proliferation and that soluble gp39 alone in a non-membrane bound form is able to provide co-stimulatory signals to B cells.

Fusion proteins consisting of the extracellular region of murine B7 .1 or B7 .2 and the Fc portion of murine IgG2a (B7 -IgG) were evaluated for their ability to promote antitumor responses. Therapeutic administration of soluble B7 -IgG in mice with established tumors induced complete regression of the tumor and increased the survival of mice. In three models, MethA, P815, and MB49, mice with 7-day-old established tumors were cured with two to three treatment cycles of B7 -IgG, given twice a week. Even in mice with an established B16/F10 tumor (a poorly immunogenic melanoma), therapeutic treatment with B7 -IgG alone slowed tumor growth and increased survival significantly. Still stronger antitumor activity was achieved when B7 -IgG was used as a vaccine adjuvant mixed with irradiated tumor cells. In 80% of mice with 7-day-old B16 tumors, tumors regressed completely, and mice survived for at least 80 days. In all tumor models, B7 .1-IgG and B7 .2-IgG had similar antitumor activity. B7 -IgG-mediated tumor rejection was dependent on T cells, specifically CD8 cells, as demonstrated by the failure of B7 -IgG to induce tumor regression in severe combined immunodeficient or CD8-depleted mice. In addition, mice that were cured of an established tumor were protected against a rechallenge with the same tumor for at least 4 months, suggesting the generation of memory responses.

Surprisingly, the antitumor activity of B7 -IgG was independent of IFN-gamma, as demonstrated by tumor rejection in IFN-gamma knockout mice. Our findings demonstrate the potent capacity of B7 -IgG to generate or enhance antitumor immune responses and suggest the clinical value of B7 -IgG.

Induction of therapeutic T-cell immunity by tumor targeting with soluble recombinant B7 -immunoglobulin costimulatory molecules.

Tumor targeting with immunomodulatory molecules is an attractive strategy to enhance the host's antitumor response. Expression of CD80 (B7 -1) and CD86 (B7 -2) costimulatory molecules in **tumor** cells has proven to be an efficient way to enhance their immunogenicity. Here, we studied the effects of **tumor** targeting with biotinylated recombinant soluble B7 -1- and B7 -2 immunoglobulin G molecules (bio- B7 -IgG) using a pretargeting approach based on the sequential use of a biotinylated antitumor monoclonal antibody and avidin. Mouse RMA T-lymphoma cells bearing either bio- B7 -1-IgG or bio- B7 -2-IgG on their surface prime in vitro naive CD8+ CTLs, which are highly effective in adoptive immunotherapy, and induce therapeutic immunity when injected in **tumor**-bearing animals. In vivo targeting of established RMA **tumors** with bio- B7 -IgG either cures **tumor**-bearing mice or significantly prolongs their survival. The antitumor response induced by targeted bio- B7 -IgG depends on both CD4+ and CD8+ T cells. Moreover, **tumor** targeting with bio- B7 -IgG in vivo is critical for both expansion in lymphoid organs and mobilization into the **tumor** of **tumor**-specific CD8+ CTLs. When targeting is performed on poorly immunogenic TS/A mammary adenocarcinoma, only bio- B7 -1-IgG primes naive CTLs in vitro and cures or significantly prolongs the survival of **tumor**-bearing mice in vivo, confirming that the two costimulatory molecules are not redundant with this **tumor**. Altogether, these data suggest that **tumor** avidination and targeting with soluble bio- B7 -IgG may represent a promising strategy to enhance the antitumor response in the host.
